WORK EXPERIENCE

Sigma Computing | San Francisco, CA

Dec. 2025 – May 2026

Senior Software Engineer

- Developed a dashboard and alerting framework for our AI Assistant features
- Integrated Sigma metrics into the AI Assistant tool

NVIDIA | Santa Clara, CA

Oct. 2024 – Dec. 2025

Senior Software Engineer

- Developed a prediction engine to predict host failures before they happen, speeding up repairs
- Wrote an A/B tester to test custom prediction rules against live data
- Led an effort to make visualizations for drains kicked off by our health check software

Dropbox | San Francisco, CA

Jul. 2021 – Oct. 2024

Software Engineer

- Created monitoring and alerting pipeline for GPU hardware failures as part of Dropbox's AI-first initiative
- Improved logging, alerting, and availability zone selection for new instance provisioning in our AWS EC2 pipeline
- Converted fleet from unsecure shared to cryptographically secure HMAC-derived IPMI credentials
- Automated DNS record generation for PDUs, previously a time-consuming and manual process
- Created a machine learning model with xgboost to predict rack drain times, saving network engineers time when prioritizing racks to drain during ToR switch maintenance
- Updated Chef binary version fleet-wide and created workflow for a regular update cadence
- Created monitoring to automatically route hosts with read-only mountpoints to technicians for repair
- Led an effort to reduce oncall toil and fix alerts, reducing alert time by 50% over a 3-month period

Software Engineer Intern

May 2020 – Aug. 2020

- Wrote backfill and validation utilities for device and network records in our network source of truth database
- Designed an automatic DHCP configuration generator, improving config generation speeds by 7x

UC Berkeley EECS Department | Berkeley, CA

Teaching Assistant – Great Ideas of Computer Architecture

Jun. 2019 – May 2020

EDUCATION

University of California, Berkeley | Berkeley, CA

Bachelor's in Computer Science, Bachelor's in Data Science: GPA: 3.91

Jun. 2017 – May 2021

PROJECTS

Neural Network Image Classifier (Python)

- Designed a deep convolutional neural network with pytorch to classify images from the ImageNet dataset
- Used various image perturbation methods to build robustness and allow for better transfer learning

Encrypted File Sharing System (Golang)

- Utilized cryptographic primitives such as AES and HMAC to build an end-to-end encrypted file sharing system
- Supported sharing files between multiple users as well as a mechanism to revoke access

SKILLS

- Advanced proficiency in Python, Golang, Java
- Proficient in Git, SQL, AWS, C, Chef, gRPC, Linux, HTML, CSS, Typescript
